

Sense of M_O

Example 1:

Determine the sense of M_O for each example below:

Example 2: Determine M_O for each example

Moments of Multiple Forces— Principle of Moments

For coplanar forces, resultant moment about a point equals sum of individual moments caused by each of the forces about that point.

$$M_{RO} = \sum M_{iO} = \sum F_i d_i$$

Example 3:

Determine the moment about point O caused by the force shown.

Find: M_o

Given: F , geometry

$$M_o = Fd$$

$$l = \sqrt{5^2 + 2^2} = \sqrt{29}$$

$$\phi = \tan^{-1}\left(\frac{2}{5}\right) = 21.8^\circ$$

$$\theta = 90^\circ - (30^\circ + \phi) = 38.2^\circ$$

$$d = l \cos \theta = 4.23 \text{ m}$$

$$M_o = (100\text{N})(4.23 \text{ m})$$

$$M_o = 423 \text{ Nm}$$

Moment of a Couple

Couple:

- Two parallel forces with equal magnitudes, opposite directions, separated by a distance.
- They generate a pure rotation (no translation).

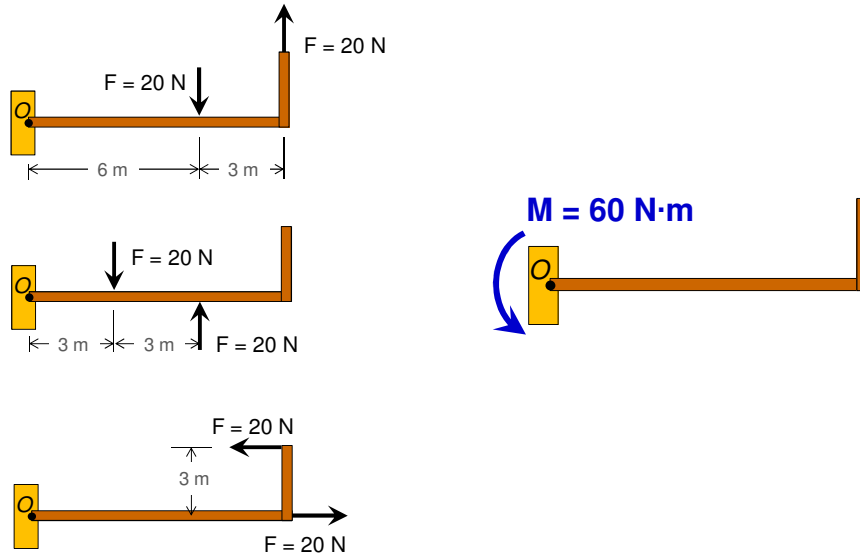

Moment of Couple

$$M = F d$$

Equivalent Couples

A Couple Moment is a **Free Vector**

Example 4: Determine the couple moment created by the forces shown.
